## Question 1 (9 marks):

A generic `Event` class is defined as follows: \*\*class\*\* Event { \*\*private\*\* String eventID; \*\*private int\*\* numberOfRaces; \*\*private\*\* Race[] races; \*\*private\*\* Race finals; \*\*public\*\* Event(String ID, int numberOfRaces) { eventID = ID; races = \*\*new\*\* Race[numberOfRaces]; \*\*for\*\* ( \*\*int\*\* i = 0; i < numberOfRaces; i++) { races[i] = \*\*new\*\* Race(); } finals = \*\*new\*\* Race(); } \*\*public void\*\* addSwimmers() { // fills the qualifying heats with swimmers } \*\*public void\*\* fillFinals() { // fills the finals race with the best 8 from the qualifying heats } // more methods() } The EventEvent class above assumes that the event has more than 8 swimmers and requires qualifying heats. However, an event with less than 9 swimmers has no qualifying heats. original EventEvent class was inherited by а the FinalsOnlyEventFinalsOnlyEvent. The same method identifier `addSwimmers` is used in both classes `Race` and `Event`. Explain why this does not cause a conflict. [3] a. Outline \*\*two\*\* advantages of the OOP feature "inheritance". [4] b. Outline how method overriding can help to create the new class `FinalsOnlyEvent`. [2] c.
